

Arpolith Installation Guide

Arpolith is an organic moisture and dust control arena additive. It can store up to 30x its weight to help regulate moisture in your arena.

- Guaranteed for 2 years but can be restored by adding additional granulates..
- Compatible with magnesium chloride and other dust control additives.
- Suitable for older riding surfaces to improve soil structure.

Preparing your arena:

Before installing GGT Arpolith, loosen and level riding surface well using a leveler. Surface **MUST** be evenly dry and clean of any manure.

Installing Arpolith on a wet surface will cause the granulates to immediately start absorbing water. If you choose to add to a wet arena, incorporation can only be done through a rotary harrow or milling machine.

Directions:

Step One: Distribute the Arpolith evenly across the arena surface. This can be done by hand or with seeding unit. For larger arenas, use a tractor and fertilizer spreader.

Step Two: After application, work the granulate into the footing around 1 inch deep. Mix well with an arena leveler. We recommend using a leveler with 1-2 rows of spring tines, a smoothing sheet, and compaction roller.

Step Three: Once the Arpolith and footing are properly mixed, water the arena to initiate the granulates.
